

Diagnosed diabetes

Figure 14.1. Prevalence of diagnosed diabetes among adults aged 18 and over: United States, 1997–2015

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Prevalence of diagnosed diabetes is based on self-report of ever having been diagnosed with diabetes by a doctor or other health professional. Persons reporting “borderline” diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses exclude persons with unknown diabetes status (about 0.1% of respondents each year). See [Technical Notes](#) for more details.

DATA SOURCE: NCHS, National Health Interview Survey, 1997–2015, Sample Adult Core component.

- For 2015, 9.5% (95% confidence interval = 9.07%–10.02%) of adults aged 18 and over have been diagnosed with diabetes. This percentage was not significantly different from the 2014 estimate of 9.1%.
- The prevalence of diagnosed diabetes among adults aged 18 and over increased from 5.1% in 1997 to 9.5% in 2015.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Prevalence of diagnosed diabetes is based on self-report of ever having been diagnosed with diabetes by a doctor or other health professional. Persons reporting “borderline” diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses exclude the 0.1% of persons with unknown diabetes status. See [Technical Notes](#) for more details.

- For both sexes combined, the prevalence of diagnosed diabetes increased with age. Adults aged 65 and over (21.7%) were more than 9 times as likely as those aged 18-44 (2.2%) to have been diagnosed with diabetes. Men aged 65 and over (24.0%) were more than 12 times as likely as men aged 18-44 (1.9%) to have been diagnosed with diabetes, while women aged 65 and over (19.8%) were more than 7 times as likely as women aged 18-44 (2.5%) to have been diagnosed with diabetes.
- For adults aged 45-54 and 65 and over, women were less likely than men to have been diagnosed with diabetes. For adults aged 18-44, women were more likely than men to have been diagnosed with diabetes.

Figure 14.3. Age-sex-adjusted prevalence of diagnosed diabetes among adults aged 18 and over, by race/ethnicity: United States, 2015

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Prevalence of diagnosed diabetes is based on self-report of ever having been diagnosed with diabetes by a doctor or other health professional. Persons reporting “borderline” diabetes status and women reporting diabetes only during pregnancy were not coded as having diabetes in the analyses. The analyses exclude the 0.1% of persons with unknown diabetes status. Estimates are age-sex-adjusted using the projected 2000 U.S. population as the standard population and using age groups: 18–44, 45–54, 55–64, and 65 and over. See [Technical Notes](#) for more details.

- The age-sex-adjusted prevalence of diagnosed diabetes was 11.9% for Hispanic persons, 7.2% for non-Hispanic white persons, and 12.5% for non-Hispanic black persons.
- The prevalence of diagnosed diabetes was lower among non-Hispanic white persons than among Hispanic persons and non-Hispanic black persons.

2015	9.5 (9.07-10.02)	8.5 (8.10-8.89)

¹Crude estimates are presented.

²Estimates are age-adjusted using the projected 2000 U.S. population as the standard population and four age groups: 18–44, 45–54, 55–64, and 65 and over.

NOTES: Data are based on household interviews of a sample of the civilian noninstitutionalized population. Beginning with 2012 data, the National Health Interview Survey transitioned to weights derived from the 2010 census. For 2003–2011 data, weights were derived from the 2000 census. In this Early Release, estimates for 2000–2002 were recalculated using weights derived from the 2000 census. For 1997–1999 data, weights were derived from the 1990 census.
